AHKFlow workflow — eight stages

Exit condition, then where success goes and where failure goes. Canonical text: workflow.md. Full tree with all five edges: workflow.html.

	STAGE	EXIT CONDITION	SUCCESS	FAILURE
0	**Intake**	Item filed with the script, summary written, Difficulty set	`1-pickup`	`stay`
1	**Pickup**	Location chosen by Difficulty, session inside it, base confirmed and stated, PR route in place	`2-design/3-plan/4-execute`	`stay`
2	**Design**	Spec committed, terms and ADRs written, plain summary confirmed	`3-plan`	`stay`
3	**Plan**	Plan committed, grilled, fabrication-checked	`4-execute`	`stay`
4	**Execute**	All planned work committed, tracking current, closing verdicts stated, Gate green on the final revision, stage push done	`8-review`	`stay`
8	**Review**	Every review this round triaged, no required finding left open, all threads resolved, Gate evidence valid for the final revision	`9-ship`	`4-execute`
9	**Ship**	Records closed, PR ready, CI green, merged	`10-cleanup`	`4-execute`
10	**Cleanup**	Worktree gone, branch deleted, memory updated	`terminal`	`stay`

Targets: a stage id goes to that stage. 2-design/3-plan/4-execute is the Difficulty split. stay means remain here. terminal means no next stage. The other three edges — blocked, not applicable, resume — are in workflow.md and workflow.html.
